

DIABETES CONTROL

ACTION STEPS

WHAT?

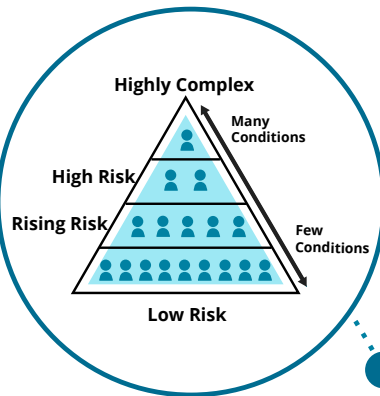

Nesting clinical care improvements within system improvements.

WHY?

Performance on key clinical conditions can improve when evidence-based, condition-specific interventions are combined with evidence-based, systems-level interventions.

1 Engage leadership to prioritize diabetes care

2 Apply population health management strategies, including risk stratification and registries

3 Design models of care that incorporate diabetes evidence-based interventions

4 Create or update clinical policies and standing orders based on evidence-based practice guidelines

5 Redefine the roles of care team members to work in new innovative ways

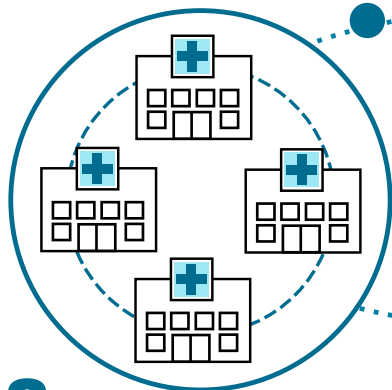

2

6 Create or update EHR templates to capture data on screening UDS and other measures

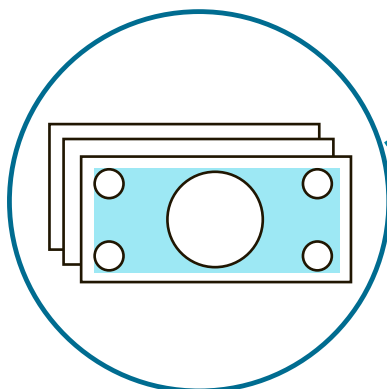

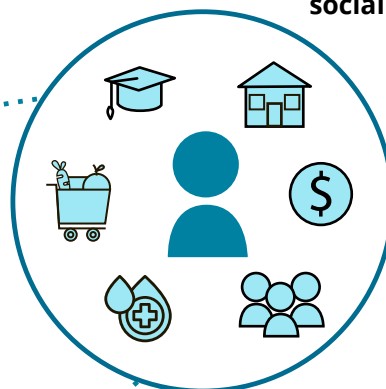

7 Establish systems to use patient engagement tools and support patient self-management and shared decision-making

8 Create a list of community partnerships and referral processes with them to support patient needs

9 Tailor treatment for social context

10 Collect reimbursement for all evidence-based care and services
