Value Transformation Framework

INFRASTRUCTURE

IMPROVEMENT STRATEGY
Effectively and routinely measure and communicate information about the quality, value, and outcomes of the health care experience and use this information to drive improved performance.

HEALTH INFORMATION TECHNOLOGY
Leverage health information technology to track, improve, and manage health outcomes and costs.

POLICY
Pursue decisions, plans, and actions that help secure support and resources for health centers and expand access for underserved populations.

PAYMENT
Utilize value-based and sustainable payment methods and models to facilitate care transformation.

COST
Effectively address the direct and indirect expense of delivering comprehensive primary care to health center patients while considering the total cost of care for attributed patients.

CARE DELIVERY

POPULATION HEALTH MANAGEMENT
Use a systematic process for utilizing data on patient populations to target interventions for better health outcomes, with a better care experience, at a lower cost.

PATIENT-CENTERED MEDICAL HOME
Employ a model of care that transforms the delivery of primary care into a comprehensive, patient-centered system focused on high quality, accessible, and coordinated care.

EVIDENCE-BASED CARE
Make patient care decisions using a process that integrates clinical expertise and best-practice research with patient values and self-care motivators.

CARE COORDINATION AND CARE MANAGEMENT
Facilitate the delivery and coordination of care and manage high-risk and other subgroups of patients with more targeted services, when and how they need it.

SOCIAL DRIVERS OF HEALTH
Address the social and environmental circumstances that influence patients' health and the care they receive.

PEOPLE

PATIENTS
Intentionally and actively incorporate the patient perspective into governance, care system design, and individual care.

CARE TEAMS
Utilize groups of staff with different skills to work together to deliver and improve care, offering a wider range of services more efficiently than a provider alone.

GOVERNANCE AND LEADERSHIP
Apply position, authority, and knowledge of leaders and governing bodies (Boards) to support and advance the center's people, care delivery processes, and infrastructure to reach transformational goals.

WORKFORCE
Leverage a trained and fully engaged staff to successfully address the health center's mission and goals, with optimal joy in work.

PARTNERSHIPS
Collaborate and partner with external stakeholders to pursue the Quintuple Aim.

The Value Transformation Framework **distills research and evidence-based practices into clear pathways for change**, known as Change Areas

Our Goal

Quintuple Aim Goals

Improved Performance through Systems Transformation

CARE DELIVERY | INFRASTRUCTURE | PEOPLE

LEADERSHIP

WHY
is Leadership Critical to Transformation?
As healthcare moves from volume to value-based reimbursement, the business model and care model must connect and support one another. How a leader or governing body uses their position and knowledge to lead people, care delivery systems, and infrastructure is essential to reaching improvements in the Quadruple Aim goals: improved health outcomes, improved patient and staff experience, and reduced costs. Leaders who embrace this shift early can advance their organizations to deliver better care with more efficiency, gaining a competitive advantage. This Guide focuses on actions that leaders can take to create the environment, skills, and structure needed to support transformation.

WHAT
is Leadership's Role in Transformation?
Organizational transformation requires that leaders develop organizational will, identify change ideas that can advance the organization, and then execute those ideas. A key role in this process of Will-Ideas-Execution is providing the structure that allows for success. Transformation from a volume to value-based health care organization requires leadership attention to the infrastructure, care delivery and people systems. While leadership encompasses such roles as administrators and the Board, this Action Guide is focused on steps that can be taken by the Chief Executive Officer in support of transformation. This begins with establishing a well communicated strategic vision for the organization and then translating that vision into an operational plan, with systems that can evolve as needed with bottom-up and top-down improvements. This requires a relentless focus on achieving Quadruple Aim goals while progressing toward these goals one step at a time. And while "leading" is critical to whole system change, one of the most important elements in this process of transformation is staff engagement and support.
Leaders can drive and inspire change by engaging the entire team and valuing ideas for improvement at all levels.

Empanelment

January '22

Health center field example by:

Northend Waterfront Health

Microlearning: What, Why, How?

STEP 1 Document your patient-provider assignment policies and procedures

STEP 2 Check effectiveness of patient-provider assignment process

STEP 3 Determine each PCP's 'right' panel size

STEP 4 Adjust 'actual' panel size toward 'right' panel size

STEP 5 Use the 4-cut methodology to suggest PCP assignments

STEP 6 Review Panels by PCP, Seek PCP and Care Team Input

STEP 7 Use risk stratification to segment and manage patient panel

STEP 8 Optimize care team roles for effective panel management

STEP 9 Use empanelment data to improve patient access

STEP 10 Incorporate payer attribution data

Step 3: Determine each PCP's 'right' panel size

A **provider's right panel size** is the number of patients a provider can reasonably support.

Unique to provider: A right panel size is based on a provider's schedule availability and complexity of patients. Determining a right panel size can be accomplished through a series of calculations measuring supply and demand using this worksheet: [Right Size Panel](#)

Demand:

of appointments needed
for current panel

of unduplicated patients
seen in the last year

x

average # of visits per patient
per year

Supply:

Provider availability

of appointment slots
available on the schedule last
year

Right Panel Size:

of patients a provider can
support based on current

CARE DELIVERY INFRASTRUCTURE PEOPLE

POPULATION HEALTH MANAGEMENT
EMPANELMENT

**WHY
Empanelment?**

Empanelment builds the patient-provider relationship that is at the center of patient-driven primary care. It is a fundamental population health management activity that matches every health center patient with a primary care provider (PCP) and care team who assumes responsibility for their care.

Empanelment supports continuity of care and offers stability and predictability to a practice, allowing it to focus proactively on managing the health of a population of patients. The provider-patient consistency that results from empanelment allows for improved communication, better identification of medical problems, more consistent treatment approaches, and improved clinical outcomes¹.

Empanelment also allows health center leaders to evaluate provider workload, distribution, and staffing models. It assists frontline staff in essential tasks such as scheduling patient appointments with the correct provider and team. In addition, empanelment provides essential information about patient access to care within the health center and continuity of care that allows leaders to make data-driven decisions supporting practice management and growth².

Empanelment is a vital foundational step toward health care systems change and the Quintuple Aim goals of improved health outcomes, improved patient experience, improved staff experience, reduced costs, and improved equity.

**POPULATION
HEALTH
MANAGEMENT**

The Value Transformation Framework addresses how health centers can use a systematic process for utilizing data on patient populations to target interventions for better health outcomes, with a better care experience, at a lower cost, and improved equity. This Action Guide focuses on one foundational component of population health management: empanelment.

**WHAT
is Empanelment?**

Empanelment is the process of matching every patient with a PCP and care team, taking patient and family preference into consideration. It identifies the population of patients a provider and care team are responsible for.

Risk Stratification

Health center field example by:

ZUFALL HEALTH COMMUNITY HEALTH CENTERS **Zufall Community Health Centers**

Microlearning: What, Why, How?

- STEP 1 COMPILE:** a list of health center patients
- STEP 2 SORT:** identify stratification criteria; weight
- STEP 3 STRATIFY:** patients to segment into target groups
- STEP 4 DESIGN:** care models and target interventions for each risk group

Step 3: **STRATIFY: Assign patients into target groups**

Arrange patients from highest risk score to lowest risk score.

This can be done for the overall population or provider panel, depending on size of your health center.

Risk Level	Total Risk Score (Example)	Estimated % patient population
Highly complex	>20	5-10%
High Risk	11-20	20-30%
Rising Risk	2-10	40-50%
Low Risk	0-1	10-20%

Patient Name	Risk Score	
Patient A	22	Highly complex
Patient B	18	
Patient C	16	
Patient D	12	High risk
Patient E	10	
Patient F	9	Rising risk
Patient G	5	
Patient H	5	
Patient I	4	
Patient J	3	
Patient K	3	Low risk
Patient L	2	
Patient M	1	
Patient N	0	
Patient O	0	

Remember: Risk groups are a tool for targeting services, they are not a clinical diagnosis.

CARE DELIVERY | INFRASTRUCTURE | PEOPLE

POPULATION HEALTH MANAGEMENT
RISK STRATIFICATION

WHY Risk Stratification?

Risk stratification enables providers to identify the right level of care and services for distinct subgroups of patients. It is the process of assigning a risk status to patients, then using this information to direct care and improve overall health outcomes.

Population health management requires practices to consider patients as both individuals and as members of a larger community or population. At the individual level, a patient's risk category is the first step towards planning, developing, and implementing a personalized care plan. One common stratification method is to segment patients by "risk" level: high-, medium- (rising), and low- risk. At the population level, risk stratification allows care models to be personalized to the needs of patients within each subgroup. (See Models of Care Action Guides.)

A "one-size-fits-all" model, where the same level of resources is offered to every patient, is clinically ineffective and prohibitively expensive. To maximize efficiency and improve outcomes, health centers must analyze their patient population and customize care and interventions based on identified risks and costs^{1,2,3,4,5}. Healthy patients, for instance, may not want a high level of intensive support, and can be engaged through alternate models of care⁶. With this in mind, high-intensity resources can and should be reserved for high-risk patients. Care models based on risk with customized care at each level can flexibly match need with more appropriate resources^{1,2,3,4,5}. Organizations who succeed in a value-based care environment utilize risk stratification as a tool to drive population health.

POPULATION HEALTH MANAGEMENT

The Value Transformation Framework addresses how health centers can use a systematic process for utilizing data on patient populations to target interventions for better health outcomes, with a better care experience, at a lower cost, and improved equity. This Action Guide focuses on one foundational component of population health management: risk stratification.

WHAT is Risk-Stratification?

The goal of risk stratification is to segment patients into distinct groups of similar complexity and care needs. For example, out of every 1,000 patients in a panel, there will likely be close to 200 patients (20%) who could benefit from more intensive support. This 20% of the population accounts for 80% of the total health care spending in the United States^{7,8}. Of these "higher need" patients, five percent (5%) account for nearly half of U.S. health expenditures^{9,10}. Health care spending for people with five or more chronic conditions is 17 times higher than for people with no chronic conditions¹¹.

CARE DELIVERY INFRASTRUCTURE PEOPLE

CARE TEAMS

WHY
Focus on Care Teams?

Much has been written about the success of the "care team model" in delivering high-quality, low-cost, impactful health care. Developing an effective team-based model of care is at the heart of health center efforts to deliver on the Quintuple Aim: improved health outcomes, improved staff and provider experiences, lower costs, and improved equity.

Transitioning to value-based care requires a significant shift in the way care delivery, infrastructure, and people are engaged and deployed in the health care system. In the volume-based system, a primary care physician would need to spend an estimated 21.7 hours per day to provide all recommended acute, chronic, and preventive care to a panel of 2500 patients¹. It is, therefore, not surprising that physicians face burnout and adults in the U.S. receive only 55% of recommended services². The volume-driven model of care coupled with the complexity of preventive, acute, and chronic care needs in the context of a primary care visit, limits the quality of service delivered³. A reinvention of the care team model—with more responsibility given to supportive members of the care team—has proven to optimize the experience and outcomes of primary care for patients, providers, and staff⁴. In addition to improving service for chronic disease and preventive care, re-organizing care team roles can help address the widely documented problem of primary care physician shortages^{5,6,7}.

Ultimately, patient care is a team sport. All members of the health center team are accountable for the delivery of high quality care to patients. Patient engagement, also crucial to care, is addressed in the *Patient Engagement Action Guide*.

While many health centers report using a team-based approach to care, these systems may not be functioning optimally to achieve desired outcomes. This Action Guide offers steps to more effectively distribute, or share, responsibility and accountability across health center care teams.

*"Sharing the care involves both a paradigm shift and a concrete strategy for increasing capacity. The paradigm (culture) shift transforms the practice from an "I" to a "we" mindset. Unlike the lone-doctor-with-helpers model, in which the physician assumes all responsibility, makes all decisions, and delegates tasks to team members (but cannot increase capacity), the "we" paradigm uses a team comprising clinicians and non-clinicians to provide care to a patient panel, with a reallocation of responsibilities, not only tasks, so that all team members contribute meaningfully to the health of their patient panel."*⁸

CARE MANAGEMENT

WHY
Use Care Management with High-Risk Patients?

Value-based care requires health care organizations to better control the clinical and financial risks associated with high-risk patients. A systematic process for managing the care of high-risk patients, using proven interventions in a supportive one-on-one environment, has been shown to improve health outcomes^{1,2}. High-risk patients, by definition, have multiple health needs often compounded by complex social and other issues. These patients are at risk for poor health outcomes, inadequate quality of care, and increased costs^{3,4}. The Centers for Medicare and Medicaid Services (CMS) recognizes care management as a critical tool to achieve the Quadruple Aim: improved health outcomes, improved patient and staff experiences, lower costs, and improved equity⁵.

This Action Guide provides the steps to start a health center care management program for high-risk patients. The outlined recommendations meet the requirements of Chronic Care Management (CCM) services defined by CMS and, therefore, are eligible for reimbursement.

WHAT
Does a High-Risk Care Management Model Look Like?

High-risk care management involves intensive, one-on-one services, provided by a nurse or other health worker, to individuals with complex health and social needs. The formal design of a health center care management program can ensure a standardized approach to managing high-risk patients by a care manager. The model discussed in this Action Guide is based on a nurse in the role of care manager. Other staffing models can be employed with some modification. Key components of care management include: identifying and engaging high-risk individuals, providing a comprehensive assessment, creating an individual care plan, engaging in patient education, monitoring clinical conditions, and coordinating needed services^{6,7,8}.

Important CMS Guidance Update!

An initiating visit is required prior to the start of care management services during which **the practitioner must discuss care management services with the patient.**

Qualifying initiating visits:

- ✓ Initial Preventive Physical Examination (IPPE)
- ✓ Annual Wellness Visit (AWV)
- ✓ Evaluation and Management service (E/M)
- ✓ The face-to-face visit included in Transitional Care Management (TCM)

What are the services that encompass care management in an FQHC?

CCM	CCCM	PCM	BHI	CoCM	TCM
Chronic Care Management	Complex Chronic Care Management	Principal Care Management	Behavioral Health Integration	Psychiatric Collaborative Care Model	Transitional Care Management
Multiple (two or more chronic conditions) expected to last at least 12 months or until the patient dies, or places the patient at significant risk of death, acute exacerbation/ decompensation, or functional decline.	Multiple (two or more complex chronic conditions) expected to last at least 12 months or until the patient dies, or places the patient at significant risk of death, acute exacerbation/ decompensation, or functional decline. Complex CCM patient is at a moderate or high MDM.	A qualifying condition that is expected to last at least 3 months and places the patient at significant risk of hospitalization , acute exacerbation/ decompensation, functional decline or death. PCM patient is at a moderate or high MDM.	Integrated behavioral health and primary care services that does not require, but may use, services of psychiatric consultation or designated behavioral health manager.	Integrated behavioral health and primary care services but with two additional service components beyond general BHI: a dedicated care manager and psychiatric consult.	Supports the transition and coordination of services from an inpatient/acute care setting to a community care setting by establishing a coordinated plan with the patient's PCP. TCM patient is at a moderate or high MDM.

VALUE TRANSFORMATION FRAMEWORK
Action Guide

HEALTH CENTER

INFRASTRUCTURE CARE DELIVERY PEOPLE

PAYMENT
CARE MANAGEMENT & VIRTUAL COMMUNICATION SERVICES

WHY
structure care management services to meet CMS* reimbursement requirements?

Care management services are an essential population health activity under value-based care. Health centers are in a position to offer care management services to a wide range of people who have higher risks for some of the most common chronic conditions. Many of these patients clinically qualify for, and would benefit from, care management (See the Value Transformation Framework's *Care Management Action Guide*).

Health centers have the opportunity to obtain revenue above and beyond their federally-qualified all-inclusive flat rate when they offer, document, and bill for allowable care management services. This additional revenue can help fund systems transformation as well as be an important part of a health center's value-based care model.

CMS allows Federally Qualified Health Centers (FQHCs) to separately bill for care management services and virtual communication services (not a care management service), including:

- Chronic Care Management (CCM)
- Complex Chronic Care Management (CCCM)
- Principal Care Management (PCM)
- Transitional Care Management (TCM)
- General Behavioral Health Integration (BHI)
- Psychiatric Collaborative Care Model (CoCM)
- Virtual Communication Services (VCS)

To obtain revenue for care management services that benefit high risk patients, health center staff must establish systems to identify those in need of care management services, and establish processes to provide, document, and bill for these services. This action guide, and companion set of *Reimbursement Tips*, is designed to support health centers in this process of establishing and obtaining reimbursement for care management and virtual communication services.

Evidence Based Care

EVIDENCE-BASED CARE

Action Guide

VALUE TRANSFORMATION FRAMEWORK
Companion Action Guide

EVIDENCE-BASED CARE

WHY
take a systems approach to evidence-based care?

When "evidence" is the foundation for care decisions and interventions - rather than opinion, common practice, or expediency - better outcomes can be achieved. Performance on key clinical conditions can improve when decisions to implement evidence-based condition-specific interventions are combined with evidence-based systems-level interventions.

This strategy supports value transformation - the process of changing organizational systems of infrastructure, care delivery, and people in order to reach the Quadruple Aim goals of: improved health outcomes, improved patient and staff experience, and reduced costs.

WHAT
can health centers do differently when it comes to evidence-based care?

Health centers can "package" condition-specific, evidence-based interventions with systems-level interventions for greater impact. The Community Preventive Services Task Force (CPSTF) recommends multi-component interventions be used to address disease-specific conditions.¹

The National Association of Community Health Centers' (NACHC) Value Transformation Framework offers a process for considering and applying condition-specific interventions within the context of overall health center systems-change. The Framework's accompanying Action Guides outline how to make these changes.

This Evidence-Based Care Action Guide is intended to be paired with condition-specific companion guides. It makes the broad case for nesting clinical care improvements within system improvements. Taken together, this action guide and its companions offer health centers actionable road maps to transforming health center systems and delivering evidence-based care.

HYPERTENSION SCREENING & CONTROL

For individuals with hypertension, that outcomes, improve provider experience, reduce costs, and address the Quadruple Aim. NACHC's Value Transformation Framework is designed to guide this systems transformation.

DIABETES CONTROL

Providing diabetes care that improves health outcomes, improves patient and provider experiences, and reduces costs (the Quadruple Aim) requires health centers to couple evidence-based diabetes interventions with large systems-level change. NACHC's Value Transformation Framework is designed to guide this systems approach to transformation.

CANCER SCREENING

Providing cervical and colorectal cancer screening that improves health outcomes, improves patient and provider experiences, and reduces costs (the Quadruple Aim) requires health centers to couple evidence-based cancer screening interventions with larger systems-level change. NACHC's Value Transformation Framework is designed to guide this systems approach to transformation.

WHY
Is attention to cancer screening so important?

Over 50,000 adults in the United States (U.S.) are expected to die from colorectal cancer in 2019, the third leading cause of cancer-related death.¹ Approximately 13,000 U.S. women will be diagnosed with cervical cancer in 2019, and roughly 4,250 will die.²

Screening to detect polyps or cancer at an early stage has been proven to save lives.³ The United States Preventive Services Task Force (USPSTF) gives a "Grade A," its highest endorsement—to the recommendation to screen for colorectal cancer from age 50 to 75⁴ and for cervical cancer from age 21 to 65.⁵ The Healthy People 2020 screening targets for these populations are 70.5% and 93% for colorectal and cervical cancer screening, respectively.⁶

Despite these goals, one quarter of adults 50 - 75 years old have never been screened for colorectal cancer.⁷ In 2016, 67% of eligible adults were up-to-date with colorectal cancer screening (CRCS)⁸ as compared to 40% in health centers.⁹ Screening prevalence is lower among immigrants who have been in the U.S. for less than 10 years.¹⁰

The same trends hold for cervical cancer screening, despite evidence that it also saves lives. In 2015, 81% of eligible women were up-to-date for cervical cancer screening¹¹ as compared to 56% in health centers.¹² Screening rates are lower for older women,¹³ women with no usual source of care, no health insurance, or public insurance only; women with less than a high school education; non-Hispanic Asian women; and women who were US residents for less than 10 years.¹⁴

This Evidence-Based Companion Guide on cancer screening explores the evidence-based steps for improving colorectal and cervical cancer screening in health centers. Used alongside the Evidence-Based Care Action Guide, it offers health centers an actionable road map to cancer screening within the context of whole person care.

PATIENTS
PATIENT ENGAGEMENT

WHY
Engage Patients In Care?

There is mounting evidence that patient involvement with shared decision-making and self-care improves health care quality and outcomes at a lower cost^{1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,28,29,30,31,32,33,34,35,36,37,38,39,40,41,42,43,44,45,46,47,48,49,50,51,52,53,54,55,56,57,58,59,60,61,62,63,64,65,66,67,68,69,70,71,72,73,74,75,76,77,78,79,80,81,82,83,84,85,86,87,88,89,90,91,92,93,94,95,96,97,98,99,100}. Engaging patients in their own care and treatment decisions is encouraged by leading health care authorities such as the Agency for Healthcare Research and Quality (AHRQ)¹ and the Institute of Medicine (IOM)². Patient-centered medical home (PCMH) recognition and accreditation organizations—including the National Committee for Quality Assurance,³ the Joint Commission,⁴ and the Accreditation Association for Ambulatory Health Care⁵—all address patient engagement in their core principles.

Expectations around patient engagement are embedded in national health care legislation as part of the Affordable Care Act (Section 3506)⁶. It is a required component of the Medicare Shared Savings Program, and it is under consideration for Centers for Medicare and Medicaid (CMS) coverage.

Building a truly patient-centric health system requires actively engaging patients. It is a system where patients make informed decisions based on, not only provider and care team expertise, but also their own skills, capabilities, values, and goals. A robust patient engagement process is central to a health system that delivers on the Quintuple Aim: improved health outcomes, improved patient and provider experiences, lower costs, and equity.

This Action Guide addresses the development of patient-centric care systems through two key concepts: shared decision-making and self-care.

- Shared decision-making (SDM)** is when health care providers and patients (including their family members and caregivers) work together to make a decision that is best for the patient. This decision-making process considers evidence-based information about available options, the provider's knowledge and experience, and the patient's values and preferences⁷.
- Self-care support** is the assistance provided to patients, especially those with chronic conditions, that enables them to manage their health on a day-to-day basis⁸.

Value Transformation Framework Assessment Tool

Allows health centers, PCAs, and HCCNs to measure readiness for value-based care and monitor progress as they improve across Change Areas.

A screenshot of the 'REG LANTERN' web application interface. The header shows the logo and navigation links for 'Test Health Center A', 'NACHC Elevate', and 'Assessment'. The main content area is titled 'NACHC Elevate' and contains introductory text about the tool's purpose and instructions for taking the assessment. Below the text, there is a 'My Assessment' dropdown menu and a 'PRINT' button, with a red arrow pointing to the button. The lower section of the screenshot shows a list of 'Infrastructure' categories with their corresponding scores: 'Improvement Strategy' (2 - Basic), 'Health Information Technology (HIT)' (4 - Skilled), 'Policy' (4 - Skilled), 'Payment' (3 - Applied), and 'Cost' (2 - Basic).

VTF Assessment Tool: *Expanded Functionality*

In 2022, enhancements were made to the reporting features of the tool that allow PCAs and HCCNs to:

- view health center members' assessment results, with permission
- send notifications for assessment reminders
- view dashboard reports comparing member health center performance across change areas and timeframes
